Abstract of TW484079B

A method of supplying a product includes establishing a database comprising a number of product entries. Each product entry includes product identification information, supplier identification information and pricing information. Making the database available to retailers interested in purchasing products on the database and receiving orders for products on the database from retailers. All the orders received are aggregated for each product to generate a final aggregated order for each product. Each final aggregated order includes a final aggregated quantity and a final price. The final aggregated orders are communicated to the supplier identified by the supplier information associated with each product, and the products are received from the supplier and supplied to the retailer.
